# Bahar Ayazi

**MASc Student in Computer Engineering | Software Engineer**

Email: bahar@baharayazi.com

Website | LinkedIn | GitHub

Victoria, BC, Canada

## Summary

Software engineer with 3+ years of experience building reliable backend systems, APIs and data pipelines, now an MASc student in Computer Engineering at the University of Victoria. In industry I optimized slow APIs and databases, automated manual financial workflows, and integrated new platforms with legacy systems. In my research and coursework I apply machine learning to anomaly and fraud detection, with a focus on reproducible, well-tested pipelines. I work closely with product, business and data teams to turn requirements into practical solutions.

## Education

Present – Sep 2026
**MASc, Computer Engineering**
University of Victoria
Co-supervised by Dr. Ardeshir Shojaeinasab and Dr. Homayoun Najjaran
Coursework: Data Mining, Firewalls and Intrusion Prevention, Blockchain

2022 – 2018
**BSc, Mechanical Engineering - Biosystems**
Isfahan University of Technology
Relevant coursework: Fundamentals of Computer Engineering (A), Engineering Mathematics (A+), Numerical Methods (A)

## Research Experience

Present – Fall 2026
**MASc Research: Security of a Robotic Cell**
University of Victoria
- Working on the security component of a lab robotic cell, collecting data on normal operating behavior to detect abnormal or unsafe behavior.
- Designing the approach to generalize to other systems beyond the robotic cell.

## Projects

Fall 2026
**RAFE: Reliability-Aware Fraud Evidence Fusion**
Team Lead (4 members) | UVic Data Mining
Python, scikit-learn, XGBoost, pandas, pytest, uv, GitHub
- Designed a multi-agent fraud detector that splits each transaction into transaction, identity and behavioral feature sub-spaces, scores each with a lightweight agent, and fuses the scores with validation-measured reliability weights; agents with no evidence for a transaction do not vote.
- Built the end-to-end pipeline on 590K IEEE-CIS transactions with a leakage-free chronological split: plug-in agent/fusion interfaces, centralized and fusion baselines, ablation and latency analysis.
- Matched a centralized XGBoost baseline (PR-AUC 0.521 vs 0.517) at 2.8 ms per transaction, and improved PR-AUC by 20% (0.230 vs 0.192) on the 79% of transactions that lack identity data.
- Made every run reproducible (fixed seeds, run records with commit and data hashes, identical results from a fresh clone); led task planning, code reviews and pull-request integration.

Fall 2026
**Blockchain from Scratch (Python, ECE 519C)**
- Implemented vanity address generation, proof-of-work mining and a 3-node peer-to-peer network.

Fall 2026 **Firewall Policy Design and Testing (Cisco Packet Tracer, ECE 519B)**
- Built and tested stateless ACLs across Staff, DMZ and Outside zones.

## Professional Experience

Jul 2026 – Sep 2025 **Software Engineer**
Dotin
- Developed application-layer services and internal APIs for a middleware platform supporting infrastructure operations in a large-scale banking environment, integrating Kafka, Redis, Consul, ZooKeeper, ActiveMQ and Elasticsearch.
- Investigated legacy architecture and infrastructure tools, identified maintainability and scalability limitations, and refactored components into a modular structure.
- Worked on security-sensitive banking infrastructure involving access control, authentication, auditability and reliability.
- Independently learned unfamiliar infrastructure technologies and built custom components when existing packages did not meet project requirements.
- Translated infrastructure-team requirements and workflow gaps into features; reviewed backend and frontend code and performed end-to-end testing from the perspective of the platform's technical users.

Sep 2025 – Nov 2024 **Back-End Developer**
ActiveCleaners
- Developed data-driven backend workflows for service estimation, pricing, scheduling, provider assignment and order management on a platform combining online laundry and on-site cleaning.
- Designed logic that combines service type, item characteristics, duration, location, provider availability and capabilities to support estimation and assignment decisions.
- Designed a concurrency-safe shared wallet and payment architecture connecting a new Django application with a legacy .NET application across separate databases.
- Reverse-engineered business rules from the legacy .NET application and reimplemented them in Python/Django while preserving data integrity.
- Worked with product and engineering stakeholders to evaluate alternative solutions, identify edge cases, race conditions and data consistency risks, and design extensible workflows.

Nov 2024 – Mar 2024 **Back-End Developer (Remote, Contract)**
Tradido
- Developed backend APIs for a real-time cryptocurrency social platform with high-frequency market-data flows and performance-sensitive endpoints.
- Translated product requirements into backend workflows and scalable API designs, balancing performance and user experience.
- Proposed and shipped a lightweight keyword-based search to meet an immediate product need while keeping a migration path to Elasticsearch.
- Contributed to migrating a monolithic application toward microservices in a high-concurrency environment.
- Proactively identified product improvements and implemented new features with stakeholders.

Nov 2024 – Jan 2023 **Back-End Developer**
SnappCarfix
- Developed and maintained backend services across B2B, B2C, service-center and agent-facing products handling over 1.2 million API requests per day.
- Optimized a product-inventory API whose response time could reach several minutes, using caching, query optimization and targeted SQL to bring it into the millisecond range in production.
- Designed and implemented an automated refund workflow with business-rule validation, payment-gateway integration and concurrency safeguards against duplicate refunds,

cutting processing time from about one week to 24-72 hours and removing the manual process through a staged rollout.
- Collaborated with BI specialists on complex SQL and reporting requirements, validating data logic against backend business rules.
- Built asynchronous synchronization services with Celery and improved authentication mechanisms and backend reliability.
- Collaborated with frontend developers and product designers on user flows and API structures.
- Mentored junior backend developers through onboarding, code reviews and technical guidance.

## Skills

| | |
|---|---|
| **Programming & Frameworks** | Python, SQL, Django, Flask, FastAPI |
| **Machine Learning & Data** | scikit-learn, XGBoost, Pandas, NumPy |
| **Distributed Systems & Messaging** | Kafka, Redis, ZooKeeper, Consul, ActiveMQ, Elasticsearch, Celery |
| **Databases** | PostgreSQL, MySQL, MSSQL |
| **Infrastructure & DevOps** | Docker, Linux, Git, GitHub, GitLab CI/CD |
| **Security & Authentication** | JWT, OAuth2, OpenID Connect (OIDC), LDAP, Cisco ACLs |
| **Testing** | Pytest, Performance Testing, End-to-End Testing |
| **Soft Skills** | Leadership, Mentoring, Analytical Problem Solving, Cross-functional Collaboration, Translating Business Requirements |
| **Languages** | English (professional working proficiency, CEFR C1 / IELTS 7.0), Persian (native) |
